A method for configuring a device's interaction with an application without using cookies. The method includes entering information that needs to be used each time a transaction with an application residing on an application server is performed and storing the information at the application server. The method also includes initiating the

5   transaction between the device and the application server, and looking up based on a user indicator an automatic entry indicator. The then includes sending from the application server the information when the automatic entry indicator is indicative of automatic entry having been enabled.
